Treehouse Newsletter Signup

Create a single page application using Angular that can view, add, and remove users from a newsletter subscription list.

The application should:
- Use a recent version of Angular (at least v2.0)
- Have one page to display a list of all current submissions, with the newest users first. Users should be able to be deleted from the list.
- Have another page with a form to add a user, with a name and an email field. These fields should be required for the form to submit
- Be able to navigate between pages
- Adhere to the Angular Style Guide (https://angular.io/guide/styleguide)

A REST API is provided to you that will facilitate the required operations for managing the user list - https://treehousechallenge.contractornation.com. To access the following endpoints, include an Authorization header with the key that you were provided.

- **GET /newsletter** to retrieve a list of users already signed up
- **DELETE /newsletter/{id}** to delete a user with the specified {id}
- **POST /newsletter** to create a new user, with the following JSON body schema:

```json
{
    "name": "John Doe",
    "email": "jdoe@contractornation.com"
}
```

With your submission, please include all code for the client application.
